

AI Prompt: Prove that significant amounts of wealth flow from the global south to the global north, and that it's unfair, draining resources from the global south.

Given:

1. **Global South resources:** R_s
2. **Global North resources:** R_n
3. **Global South wealth:** W_s
4. **Global North wealth:** W_n
5. **Extracted value from Global South:** E_s
6. **Compensation to Global South:** C_s
7. **Debt repayments to Global North:** D_s
8. **Aid to Global South from Global North:** A_s
9. **Global inequality:** $I_g = W_n - W_s$

Extraction and compensation inequality:

$$E_s > C_s$$

Where E_s represents the significant extraction of raw materials, labor exploitation, and undervalued trade exported from the Global South to the Global North, and C_s is the compensation returned (e.g., wages, trade payments).

Net flow of wealth:

$$F_s = (E_s - C_s) + (D_s - A_s)$$

$$F_s > 0$$

Where F_s represents the net flow of wealth from the Global South to the Global North, taking into account debt repayments and limited aid.

Resource and wealth accumulation in the Global North:

$$R_n = R_n + E_s$$

$$W_n = W_n + F_s$$

Resource and wealth depletion in the Global South:

$$R_s = R_s - E_s$$

$$W_s = W_s - F_s$$

Global inequality amplification:

$$I_g = W_n - W_s$$

$$\text{If } F_s > 0, \text{ then } \frac{dI_g}{dt} > 0$$

Global inequality I_g worsens over time as the wealth flow F_s from the Global South to the Global North persists.

Proof of unfairness:

For fairness to hold:

$$E_s \leq C_s \text{ and } D_s \leq A_s$$

Empirical studies show:

$$E_s > C_s \text{ and } D_s > A_s$$

Therefore:

$$F_s > 0 \text{ and unfairness persists.}$$

Conclusion:

The mathematical inequalities above demonstrate that wealth and resources flow disproportionately from the Global South to the Global North, amplifying global inequality and unfairly draining resources from the Global South - a core argument of leftist theory on neocolonialism.
